

**33.49** A car is designed to have a top speed of  $120\text{mph}$ . The drag coefficient is  $0.4$  and the frontal area is  $28\text{ft}^2$ . What is the minimum required motor size?

- A.  $16\text{hp}$
- B.  $129\text{hp}$
- C.  $160\text{hp}$
- D.  $404\text{hp}$

Find the **Drag Force** on the car by using the drag coefficient, frontal area, and velocity in  $\frac{\text{ft}}{\text{s}}$ . Note that for US customary units, the gravitational constant,  $g_c$ , must be included in the denominator for the units to work, converting  $\text{lb}_m$  to  $\text{lb}_f$ .

$$F_D = \frac{C_D \rho v^2 A}{2g_c}$$

$$v = 120 \frac{\text{mi}}{\text{hr}} \left( \frac{1\text{hr}}{3600\text{s}} \right) \left( \frac{5280\text{ft}}{\text{mi}} \right) = 176 \frac{\text{ft}}{\text{s}}$$

$$F_D = \frac{(0.4) \left( 0.075 \frac{\text{lb}_m}{\text{ft}^3} \right) \left( 176 \frac{\text{ft}}{\text{s}} \right)^2 (28\text{ft}^2)}{2 \left( 32.2 \frac{\text{lb}_m \cdot \text{ft}}{\text{lb}_f \cdot \text{s}^2} \right)} = 404\text{lb}_f$$

Use the definition of power found by searching **Power and Efficiency**. Power may be expressed as the product of force and velocity. Convert units to  $\text{hp}$ .

$$P = F \cdot v$$

$$P = \frac{(404\text{lb}_f) \left( 176 \frac{\text{ft}}{\text{s}} \right)}{550 \frac{\text{lb}_f \cdot \text{ft}}{\text{s} \cdot \text{hp}}} = 129\text{hp}$$

**Answer B**
